

Electric Pallet Jack Chain

Pallets are a vital component in the manufacturing industry. Pallet handling is accomplished by a variety of methods within a manufacturing environment. Pallet racks, forklifts, pallet trucks and hand jacks are several of machines most normally used for pallet handling in the modern work place.

Inside a production facility, most pallets are usually stacked on huge steel racks. Pallet handling falls under the tasks of the lift truck employees in view of the fact that typically, the pallets are stacked high above the floor and require a lift truck operator so as to access them and place them on the floor in smaller stacks for the personnel to access safely and more easily.

Bigger manufacturing companies can integrate a complete pallet handling system within the building, including specialized conveyors which lift pallets off of the manufacturing floor and move them to a storage area on a different floor. As soon as a pallet is requested, a message is sent to a worker in the storage area. This message results in a pallet being transferred to a precise place inside the building by the conveyor system.
